

How to turn off and isolate your water supply if you have a leak

It's important to know where your home's stopcock is located so in the event of a leak you can act quickly to turn off the water supply.

1. In most homes, you'll find the stopcock located under the sink in the kitchen or in the utility room.
2. Once you've located the stopcock, turn it clockwise to shut off the water supply.
3. You can test if this has worked by turning on one of the kitchen taps to check there's no running water.
